„ROV PHOCA“ is limping a bit…

Dr. Friedrich Abegg
During the Factory Acceptance Tests a strange behaviour of the vehicle while using station keep or auto altitude has been detected.
After several trials in natural environment like harbour basins and open water a visit of a SubAtlantic technician recently reviewed that the control software does not process the data from the DVL.
Actually SUBATLANTIC is working on that problem and we hope to receive a software update until mid of January.
Nevertheless ROV PHOCA is in an operable state with only some 'comfort' restrictions to the pilots 😊

Best regards to all OFEG TECH participants and hope to be able to participate again next year.
